1. (a) $T(x) = e^{(5/2)}(1 + \frac{(x-5)}{2} + \frac{(x-5)^2}{8} + \frac{(x-5)^3}{48} + \frac{(x-5)^4}{384})$

   $L(x) = e^{1/2}\frac{(x-3)(x-5)(x-7)(x-9)}{384} + e^{3/2}\frac{(x-1)(x-5)(x-7)(x-9)}{-96} + e^{5/2}\frac{(x-1)(x-3)(x-7)(x-9)}{64} + e^{7/2}\frac{(x-1)(x-3)(x-5)(x-9)}{-96} + e^{9/2}\frac{(x-1)(x-3)(x-5)(x-7)}{386}$

   (b)

   (c) Taylor Error $= \left|\frac{e^{12/2}(x-5)^5}{3840}\right|$

   Lagrange Error$= \left|\frac{e^{12/2}(x-1)(x-3)(x-5)(x-7)(x-9)}{3840}\right|$

   (d)

   (e)

   (f) Our Error estimates are seceral times larger than the actual error indicated. This is because our first truncated term is much larger than the next term if we went one term further. This is due to the factorial part in particular when calculating our taylor and lagrange errors.
